

R9: interference slowdown and remaining recovery space

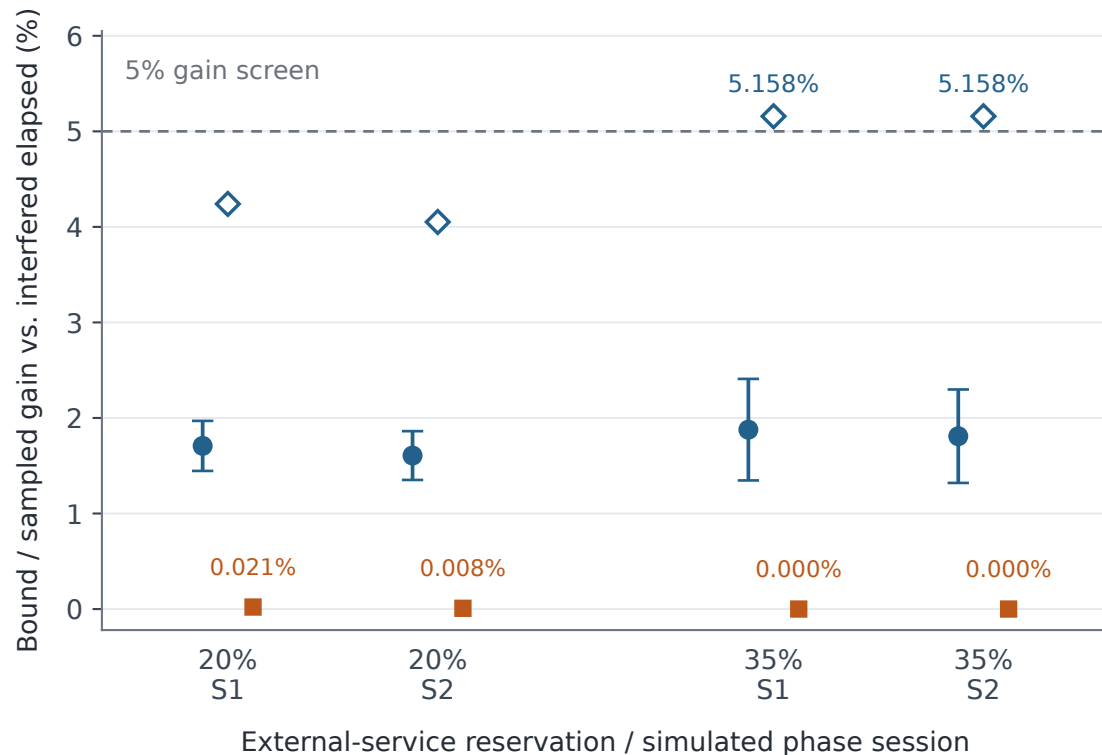

Qwen down M32 / K9216 / N128 | two clusters, two cores each | shared external service

● Mean + 95% CI ◇ Max. sampled-phase bound ■ Charged hindsight gain + 95% CI

A Fixed selected-static slowdown

B Recovery on the selected graph

Whiskers: paired-block t 95% CI; n=30 per condition/session. Main reference model only; sessions are not device runs.

Right: per-graph zero-cost recovery upper bound; sampled action costs 8 cycles, uses hindsight, and includes no-action.

Sampled maximum 5.158% exceeds the 5% screen: no uniform closure or mechanism acceptance. Source: r9/results/summary.json
